

Focus Q2 pricing on 10-lesson packs and premium coaches; a 5-10% uplift on underpriced high-volume packs could add a mid-single-digit increase in total lesson revenue if volumes hold.

Supporting findings

- Lessons and practice together contribute roughly 85–90% of monthly revenue in Q1 2026, with lessons alone at 53–60% and practice at 28–33%, making them the primary levers for pricing and packaging.

Q1 2026 revenue mix by product category and subcategory

- Revenue is highly concentrated in a small number of lesson and practice subcategories (notably 10/20/50 lesson packs and 10/25/50/100 practice credits), while many smaller offerings generate low revenue and volume, adding complexity without material financial impact.

- Realized lesson prices per session vary by roughly 10-30%+ across coaches: value coaches such as David Parlane and Jasper Park average about 730-750 per session, while premium coaches such as Lim Jihyeon, Johnson Poh, Joey Poh, and Desmond Tan average about 1,000-1,200 per session, with mid-tier coaches like Jiali Khee and Aiko H around 840-940.

- Premium coaches combine high prices with strong volumes: for lessons in Q1 2026, Lim Jihyeon generates about 130.0k revenue on 119 sessions (~1,093 per session), Johnson Poh about 63.6k on 56 sessions (~1,136), and Joey Poh about 60.7k on 50 sessions (~1,213), indicating that clients accept premium pricing for these coaches.

- High-volume 10 Lesson Packs show large price dispersion across coaches despite similar formats: for example, 10 Lesson Pack (Johnson Poh) averages about 725 per session on 199 units and 144.2k revenue, 10 Lesson Pack (Jasper Park) about 653 per session on 134 units and 87.5k revenue, 10 Lesson Pack (Desmond Tan) about 907 per session on 86 units and 78.0k revenue, 10 Lesson Pack (Aiko H) about 773 per session on 85 units and 65.7k revenue, and 10 Lesson Pack (David Parlane) about 798 per session on 53 units and 42.3k revenue.

- Across 15,236 cleaned transaction-level observations, higher quantities are generally associated with lower price per session, consistent with implicit volume discounts or package-like pricing even though product names do not explicitly flag packages.

- A significant number of transactions have positive quantities but zero revenue, indicating free or fully comped sessions that dilute average yield and may not be strategically targeted. - Coach-level performance is highly skewed: in Q1 2026, non-coach-specific items account for about 262k revenue and 2,739 sessions, while among named coaches, Lim Jihyeon leads with about 142.7k revenue and 223 sessions, followed by a small group of coaches each generating 25–67k, suggesting a clear hierarchy for tiered pricing.

Recommendations

- **Standardize and lift underpriced 10-lesson packs:** For high-volume 10 Lesson Packs priced materially below the mid-coach band (for example, around 650–750 per session vs peers at 800–900+), increase list prices by 5–10% over Q2 while keeping premium coaches at the top of the range. Prioritize large SKUs such as 10 Lesson Pack (Jasper Park) and other sub-800 packs with strong unit volumes, as even a 5% increase on a 100k-plus revenue SKU can add 5k per quarter if volumes hold.
- **Introduce explicit coach tiers and price bands:** Define at least three tiers—Premium (e.g., Joey, Johnson, Lim, Desmond), Standard (e.g., Jiali, Aiko), and Value (e.g., David, Jasper)—and set clear per-session price corridors for each tier. For example, Premium at roughly 1,050–1,250 per session, Standard at 850–1,050, and Value at 700–850, then align all new and existing lesson packs to these bands to remove unexplained gaps and anchor future increases.
- **Rationalize the long tail of low-volume products:** Identify lesson and practice SKUs that contribute a small single-digit share of revenue within their category but add menu complexity. Either (a) fold them into a smaller set of core packs (for example, migrate niche durations into 10/20/50 packs) or (b) reposition them as add-ons bundled with core packs rather than standalone offers, simplifying the price list and steering demand into higher-yield SKUs.
- **Formalize package ladders and discount levels:** Make the currently implicit volume discounts explicit and controlled. For each category, define a simple ladder such as single session (100% of base price), 5-pack (95%), 10-pack (90%), 20-pack (85%), and 50-pack (80%), calibrated by coach tier. Ensure that no pack is priced below its intended discount band and that very deep discounts are reserved for off-peak or strategic segments only.
- **Tighten rules for free and comped sessions:** Cap the share of zero-revenue sessions per coach and per product (for example, no more than 3–5% of total sessions per quarter) and require a clear reason code (trial, service recovery, marketing). Where possible, convert free trials into low-priced intro packs (for example, a 3-session starter pack at a modest discount) to preserve perceived value while still supporting acquisition.
- **Use practice credits to manage price sensitivity:** Keep practice products as the primary value entry point and

funnel into higher-priced lessons. Maintain competitive per-session pricing on core practice packs and consider small upsells (for example, practice-plus-assessment bundles) rather than aggressive price increases, as practice is likely more price-sensitive and important for volume and engagement.

- Pilot targeted price tests in Q2 rather than broad changes: Select 3–5 high-revenue lesson SKUs with clear underpricing relative to peers and run controlled 5–10% price increases for a quarter, monitoring revenue, sessions, and conversion. If volumes remain stable or decline modestly while revenue rises, roll out similar adjustments to adjacent SKUs; if volumes drop sharply, revert and treat those segments as price-sensitive.
- Align coach scheduling and capacity with pricing tiers: For premium coaches, prioritize peak-time slots and higher-margin packs; for value coaches, emphasize off-peak availability and entry-level offers. This supports the tiered pricing narrative, improves utilization, and reduces the risk that lower-priced coaches cannibalize premium demand at peak times.
- Clarify and communicate the value story: For each tier and pack, articulate the benefits (coach credentials, technology used, progression plan, flexibility) so that higher prices are justified in the client’s mind. Ensure that online and in-studio materials show a coherent structure—clear tiers, simple pack ladders, and transparent discounts—to reduce friction and discounting pressure at the point of sale.

Caveats

- Interpreted “Q1 2026” as quarter (2026-01-01 to 2026-03-31), based on anchor=run_date (2026-05-05).
- The current dataset does not allow a clean separation of GolfX Singapore from other locations; all figures and recommendations are based on the blended data and may not perfectly reflect Singapore-only performance.
- The analysis does not estimate true price elasticity by product or coach; recommended price changes are directional and should be tested in controlled pilots with close monitoring of volume and conversion.
- Package and discount behavior is inferred from quantity and realized price patterns rather than explicit package flags, so exact discount levels versus single-session benchmarks are approximate.
- No cost or margin data is available, so recommendations optimize for revenue and yield rather than profit; margin differences across products and coaches could change the prioritization of actions.
